## *Top Ways Microbes Cause Fuel Headaches for Hospitals + Health Care Facilities*

Hospitals and other health care facilities play a critical role for the populations they serve. So critical, in fact, that they are governed by industry-specific regulations put into place to help ensure their critical services are not interrupted.

<i>Top Ways Microbes Cause Fuel Headaches For Hospitals + Health Care Facilities</i>	
	Microbes degrade fuel quality which can keep emergency generators from working.
	Microbes produce biomass in fuel storage tanks which plug filters that can shut generators or emergency equipment down or keep them from running during full load.
	Microbial presence and its effect on fuel can create uncertainty about whether an emergency generator will start on demand.
	Microbes can degrade emergency backup fuel to the point that it becomes out-of-spec and fails applicable standards like Water and Sediment content, bringing the fuel (and the facility that owns it) out of compliance with AHCA standards.
	Microbes can increase the chance of having equipment or an engine unexpectedly out of service, impacting the ability to respond in critical situations.
	Microbes in fuel can often be misdiagnosed as other problems.
	Microbes can resist incorrect treatments, causing wasted time and money.

### *The Takeaway*

Microbes in emergency backup fuel and storage tanks are a big hurdle for hospitals and other critical health care facilities. But there are ways to reduce the chance fuel and tank microbes negatively impact a health care facility. Talk to us.
