It is a fact that 70% of all diesel engine break downs are caused by fuel system-related problems. In many cases the problems are caused by fuel contaminated with bacteria, fungus or mold. The residue created by these nasty little bugs plugs fuel filters, which causes difficulties with starting, poor acceleration, stalling and no-start conditions.

When moisture is present in diesel fuel bacteria, fungus and mold will begin to grow. This happens at the point where water and diesel fuel interface. **Bell Performance** specially formulates products to prevent this growth and to treat fuel systems that are already infected.
